EMPLOYMENT AND UNEMPLOYMENT.

EMPLOYMENT AND UNEMPLOYMENT,	1-114
Explanatory note,	2, 3
The Census year extended from May 1, 1894, to April 30, 1895,	2
"Regular" employment,	2
"Other" employment,	2
Explanation of the term "inapplicable,"	2
List of persons to whom the inquiries relating to employment and unemployment were deemed inapplicable in the following classes of occupations:	2
Government,	2
Professional,	2
Domestic service,	2
Personal service,	2
Trade,	3
Transportation,	3
Agriculture,	3
The Fisheries,	3
Manufactures,	3
Mining,	3
Scholars, Students, Retired, Not gainful, etc., Not productive, Dependents, At home, and Not stated,	3
Illustrations of the proper manner of reading the tables,	3
EMPLOYMENT AND UNEMPLOYMENT: BY MONTHS OF THE CENSUS YEAR,	5-91
Explanation of presentation,	2, 3
Towns in the county of Barnstable,	5-8
Cities and towns in the county of Berkshire,	8-16
Cities and towns in the county of Bristol,	16-21
Towns in the county of Dukes,	21, 22
Cities and towns in the county of Essex,	23-31
Towns in the county of Franklin,	31-37
Cities and towns in the county of Hampden,	37-43
Cities and towns in the county of Hampshire,	43-48
Cities and towns in the county of Middlesex,	48-61
Town and county of Nantucket,	61
Cities and towns in the county of Norfolk,	61-68
Cities and towns in the county of Plymouth,	68-74
Cities and towns in the county of Suffolk,	74, 75
Cities and towns in the county of Worcester,	75-89
Recapitulation. For the State,	90, 91
EMPLOYMENT AND UNEMPLOYMENT: Periods of Employment and Unemployment of Greatest and Smallest Numbers with Increases and Decreases; Yearly Aggregates of Extent of Employment with Percentages: By Towns,	90-103
Towns in the county of Barnstable,	90, 91
Cities and towns in the county of Berkshire,	90-93
Cities and towns in the county of Bristol,	92, 93
Towns in the county of Dukes,	92, 93

Figures must be accepted as indicating present conditions until the Census of 1905, . 287

THE

DECENNIAL CENSUS OF THE COMMONWEALTH.

1895.

VOLUME VII.

INTRODUCTION.

The present volume, the last of the census series, contains the following parts, each of which has been issued in pamphlet form as soon as completed:

Part 1.
Employment and Unemployment.

Part 2.
Scholars and Students: By Towns. With Sex and Descent.
Illiteracy: By Towns. With Sex and Descent; With Degree of Illiteracy by Age Periods; Comparisons for 1885 and 1895; With Occupations by Classes.
All Occupations. Recapitulations. For the State and Counties.

Each tabular presentation is accompanied with full analytical text, to which the attention of the reader is especially called.

In concluding the census volumes a condensed statement of the organization and methods pursued in the work is appropriate.

General Scope of the Census.

The Decennial Census of Massachusetts has for its primary object the enumeration of the population for the purpose of re-districting the State for the election of Senators and Representatives. It also comprehends the collection of complete statistical data as to the social status of the population, the condition of its manufacturing industries, its agriculture, fisheries, and commerce. The dates of the successive enumerations have already been alluded to in the first volume of the present series, and their relation to the dates of the Federal Census pointed out.*

---

* See Introduction to Vol. I; page xi.

Industrially, the statistics collected in the Census show the productive results in terms of value, of the Manufactures, Agriculture, and the Fisheries of the Commonwealth for the year covered by the returns. The aggregate figures in each of these branches of productive industry, as determined by the present canvass, are summarized in the following table:

Counties, Cities, and Towns.	Classification by Industrial Prominence	Population	Products			
			Manufactures	Agriculture	The Fisheries	Aggregates
Barnstable.	–	27,654	$1,160,492	$1,053,915	$748,230	$2,962,637

Upon the basis of the statistics relating to the occupations of the people contained in Volume IV of the Census series, each city and town has been classified with respect to its industrial prominence in one or more of the three branches, *i. e.*, agriculture, manufactures, or the fisheries; or, as a place of residence if not of prominence industrially. The results of this classification are brought together in the foregoing table. As explained in the analyses in Volume IV, in classifying the cities and towns under the designations employed, the following plan was pursued:

If the persons employed in the three principal productive industries, namely, agriculture, manufactures, and the fisheries, comprised more than 50 per cent of the total number of persons employed in all gainful occupations, the town has been classed as an industrial town. For example, referring to the table, in Brewster, in Barnstable County, more than 50 per cent of the persons remuneratively employed were engaged in the three industries named, bringing that town into the industrial class; of the three industries, persons engaged in agriculture predominated over the number engaged in manufactures and the fisheries combined. It is therefore called an agricultural town, designated by the initial letter A in the table. When two or more industry designations, represented in the table by appropriate initial letters, are combined, with respect to any town, it indicates that although such town is, as explained, classed as industrial, the two or more industries are of substantially equal prominence. This is the case in Falmouth, in which the number employed in agriculture and in manufactures practically balance each other.

When the number employed in the different towns in the three industries, agriculture, manufactures, and the fisheries, was less than 50 per cent of the whole number engaged in all gainful pursuits, the town has been considered residential rather than industrial, that fact being indicated by the letter R in the table. The fact that one or more of these three industries had some prominence in such towns is indicated, however, by the use of the proper initial letters, after the letter R.

Thus, referring again to the table, the town of Barnstable, in Barnstable County, is classed as a residential town, the number of persons employed therein in the three industries, agriculture, manufactures, and the fisheries, being less than 50 per cent of the

whole number gainfully employed. But, although residential, a sufficient number were employed in agriculture and manufactures to be noted by the use of the designations A and M.

In Chatham, also classed as a residential town, agriculture and manufactures are unimportant, as indicated by the number employed, and are therefore not denoted by the initial letters; but the number of persons engaged in the fisheries warrants the use of the letter F, indicating that although a residential town, a considerable number of persons are employed in the fisheries.

The following recapitulation summarizes the results of the classification for the State, in connection with the figures relating to population and products in each industrial group, with percentages:

Classification by Industrial Prominence.	Number of Cities and Towns	Population	Products				Percentages	
			Manufactures	Agriculture	The Fisheries	Aggregates	Population	Aggregate Product
Agriculture,	87	75,531	$3,994,606	$13,591,463	$95,545	$17,681,614	3.02	1.95

Residence — agriculture — fisheries — manufactures,	1	1,125	14,110	57,780	40,462	112,352	0.05	0.01
Totals,	353	2,500,183	$849,807,302	$52,880,431	$5,703,143	$908,390,876	100.00	100.00

Without repeating the various figures contained in the recapitulation, it is sufficient to note that, of all the cities and towns, 87 were classed as distinctly agricultural; that these contained 3.02 per cent of the population, and that in them was produced 1.95 per cent of the aggregate product of the State derived from manufactures, agriculture, and the fisheries. Two places were classed as principally devoted to the fisheries. In them was found but 0.22 per cent of the population, and but 0.08 per cent of the aggregate product of manufactures, agriculture, and the fisheries. There were 144 cities and towns classed as devoted principally to manufactures, and these contained 52.56 per cent of the population, and produced 61.82 per cent of the combined product of the three industries. Only one town was classed as purely residential, and in this town was found but 0.03 per cent of the population and but 0.02 of the aggregate product. The gross value for the State of the aggregate product for the Census year of manufactures, agriculture, and the fisheries was $908,390,876, apportioned as follows: manufactures, $849,807,302; agriculture, $52,880,431: the fisheries, $5,703,143.

Appointment of Enumerators.

Besides minor changes in the statute under which the Census was taken, there was one of considerable importance relating to the appointment of enumerators. In the Censuses of 1875 and 1885 it was provided that the appointment of these officers should be subject to the approval of the mayor and aldermen in cities and to that of the selectmen in towns. Local interest in the results of the Census is always very great. The provision cited was intended to secure the co-operation of the local municipal officers in the selection of competent enumerators, in order that efficient service satisfactory to those entrusted with the administration of the several city and town governments might be obtained. In practice, however, it resulted in placing the selection of the enumerators largely in the hands of the municipal officers, exercised by the recommendation of certain applicants whose approval was tacitly guaranteed. The co-operation of the local authorities in order that fit men might be obtained was desirable, but the experience of the Department made it clear that some check ought to be provided against the selection of unfit persons who might be able to secure the approval of the municipal officers. The former Chief of the Bureau, Hon. Carroll D. Wright, in referring to the appointment of enumerators, in the report of the Census of 1885, suggested the possibility of applying some form of civil service regulation in the selection of enumerators, and said:

> There should be some stringent provision of law to prevent selectmen of towns and mayors and aldermen of cities from recommending incompetent men for enumerators. By the law, the Bureau of Statistics of Labor must appoint men approved by the selectmen of towns and mayors and aldermen of cities. The accuracy and success of the enumeration depends largely upon the capacity and integrity of the body of enumerators. As a whole, the men selected for this work have been of good character and proper attainments, but in a few instances, . . . men were selected who proved unfit for any duty requiring care and integrity.

The general public service of the Commonwealth and of the cities has been under civil service regulations since 1884. The difficulty of obtaining a sufficient number of competent enumerators at the rate of pay fixed by the statute, and under the necessary limitations of residence within the respective enumeration districts, and for a comparatively brief term of office, make it impracticable to rely entirely on the usual civil service routine, applicable to clerical positions. Nevertheless, in view of the previous experience of the Department, some method of testing the competency of applicants was plainly required, and it was also thought proper that the civil service system of the Commonwealth should be recognized in connection with the appointments. At the same time, it was necessary to retain the element of local co-operation on the part of the municipal officers. The present Chief of the Bureau therefore presented to the Legislature the following, which, after due consideration, became part of the Census law:

For the purpose of securing the information called for by this act the chief of said bureau shall appoint census enumerators in each city and town in the Commonwealth, but the whole number of enumerators shall not exceed one for every two thousand persons in each city and town, according to the returns of the preceding decennial census, and shall be as many less as said chief may decide to be adequate for the duty: provided, that for the enumeration of the inhabitants and legal voters at least one person shall be appointed and compensated in each city and town; and provided, further, that each person appointed as an enumerator shall be an inhabitant of the city or town in which said person is to perform the duty required, unless a properly qualified inhabitant cannot be found to undertake the work, in which case a non-resident may be appointed.

The mayor and aldermen of cities and the selectmen of towns may nominate twice as many persons as there are enumerators to be appointed in each city or town, and of the persons thus nominated there shall be appointed as enumerators, under the provisions of this act, those found the best qualified for the work, as determined by such rules and tests as the said chief may fix, subject to the approval of the civil service commissioners of the Commonwealth. In case the mayor and aldermen and selectmen do not nominate a sufficient number of persons thus found to be properly qualified, then the said chief may appoint, subject to such tests as to qualifications as are herein provided for, the additional number required. In case any enumerator shall be found incompetent or derelict in the performance of his duty, his commission may at any time be revoked by said chief and another enumerator appointed in his place.

The paragraph cited vested the power of appointing enumerators and their removal for cause wholly in the Chief of the Bureau, and instead of requiring the approval of the local officers after appointment gave them the power of direct nomination before appointment of twice as many persons as were needed, of whom a requisite number were to be selected strictly in order of merit, under a test approved by the Civil Service Commissioners; and, in case a sufficient number of fit persons were not nominated by the local officers, provision was made for securing other persons by a test of merit. In other words, all applicants were subjected to competitive test; ample opportunity of recommendation was given to the municipal authorities, subject to such a test; and the Chief of the Bureau was not required to take incompetent persons, so far as the fact of competency could be determined by a carefully devised test of qualifications.

The selection of enumerators proceeded in accordance with the foregoing provision of law. The Commonwealth was divided into 918 enumeration districts,* and, by request of the Department, 1,836 nominations for the position of enumerator were made by the municipal authorities. The test of capacity, which was duly approved by the Civil Service Commission, was practical rather than technical, requiring no extraordinary ability or literary training on the part of the applicant, but adapted to the express purpose of determining the fitness of the nominees for the especial kind of service demanded.

The work of an enumerator is always performed under special instructions, which indicate explicitly just what he is expected to do.

* Some of these were afterward subdivided and others were cancelled, the actual number of different districts and sub-districts in which enumerators were appointed being 1,054.

Each applicant or nominee was provided with a copy of these instructions, sent to him two weeks before he was required to meet the examiners, in order that he might study them in preparation for the test of fitness. On the day appointed for the examination, the State being divided into examination districts and examiners sent into each district, the applicants were given certain hypothetical facts relating to a family in the form of a narrative, which facts they were required to then and there enter upon schedules similar to the Census schedules, in accordance with the instructions which they had previously received. Besides this, each applicant was required to state in writing his previous business experience, his habits with respect to the use of intoxicating liquor, whether he had ever been convicted of any offence, his age, and certain other personal facts that tended to show his character.

Of the 1,836 persons nominated, about 500 never appeared for examination. Of the others, each applicant, the name being unknown to the examiner, was credited by a system of percentages upon the results shown in the test, and appointments were made in order of merit, observing the conditions as to residence fixed by the statute, beginning at the top of the list and proceeding downward until a sufficient number was secured.* No considerations other than those shown upon the applicants' papers affected appointments, except that, other things being equal, veteran soldiers were given preference in accordance with the spirit of the civil service law of the Commonwealth.

The method of selection described was entirely novel in its application to the appointment of Census enumerators, and so far as known, was the first attempt to apply a standard of fitness in these appointments determined by competitive test. It entirely justified itself by the results, and not the least of its benefits was the fact that every enumerator who was appointed had been led to study the instructions under which his work would be performed some four weeks before entering upon service, and in the examination he had the important points of the schedule brought forcibly to his mind, so that when he entered upon the field work he was far better prepared than has usually been the case, and this preparation, of course, increased his efficiency and promoted the accuracy of the work.

The following tabular statement gives the percentage rating upon the test examination of the enumerators who were appointed, and the average percentage of errors made in field work:

* After receiving appointment some declined to qualify. Others were relieved on account of sickness, etc. Three appointees were removed for failure to prosecute the work with due diligence. All vacancies created after the work began were filled by re-appointment of enumerators who had completed their original assignments, or by new appointments from the original list. In all, 976 different enumerators performed work.

The preceding table summarizes the record of the enumeration in 1,045 districts and sub-districts. Actually, only 967 *different* persons are referred to, since the record of errors is made up for each enumeration district separately, and in a number of cases enumerators were assigned to more than one district. For convenience of treatment in this analysis, however, the enumerator in each district will be considered as a separate individual. The average percentage rating secured by the males under the test was 66.77, and of the females, 72.15. Of the males appointed, 127 received a percentage rating below 50. No female appointed was rated below 50. The necessity of obtaining the requisite number of enumerators led to the appointment of some who received comparatively low percentage ratings on the test, although, as has been stated, appointments were made strictly in order of rating from the highest downward.

It becomes interesting to compare the percentage of field errors with the rating of the enumerators on the test. One female who received 88 per cent on the examination made errors in field work amounting to 30 per cent.* This, however, was an exceptional case. Of the males, only 58, and of the females, only 11, made errors in field work amounting to 10 per cent or more than 10 per cent. These males received on the average 58.71 per cent on the test examination, and these females, 72.82 per cent. Errors in field work amounting to five per cent but less than 10 per cent were made by 842 males and 42 females. Of these, the males received on the average 68.34 per cent on the test examination, and the females, 72.40 per cent. Errors in field work amounting to less than five per cent were made by only 67 males and 25 females. Of these, the males received on the average 54.85 on the test examination, and the females, 71.44 per cent. The enumerators who made the smallest percentage of field errors received, as will be seen, the lowest percentage rank upon the test examinations. This is due perhaps to the fact that those who received a comparatively low percentage rank on the test were afterward urged to study their instructions carefully, especially the points upon which the examination disclosed evidences of weakness, the result of this study being better work in the field.

Besides the 967 enumerators whose record has been analyzed, there were 10 different male enumerators who made no field errors, their average percentage rating on the test examination being 70.87. One female enumerator made no field errors, her percentage rating on examination being 76.30.

The Schedules.

The schedules containing the inquiries comprehended by the Census were eight in number as follows: No. 1 — Population and Social Statistics; No. 2 — Manufactures; No. 3 — Inland Commerce; No. 4 — Agriculture; No. 5 — The Fisheries; No. 6 — Commerce: Coastwise and Ocean; No. 7 — Libraries and Reading Rooms; No. 8 — Schools and School Property. The inquiries upon these schedules were duly approved by the Governor and Council in accordance with law.

Schedule No. 1 was committed to the enumerators who began their work on the first of May, completing it within thirty days. The information relating to Agriculture was obtained subsequent to November 15 by special agents selected with particular reference to their acquaintance with agricultural matters, largely from those who had shown proficiency in the prior work of enumeration. The schedules relating to Manufactures were mailed subsequent to December 15 to persons, firms, and corporations engaged in manufacturing, a considerable number being returned by mail, and the remainder collected by special agents. Special

* The errors in field work were mainly due to failure to enter the information exactly as required by the instructions so as to put the schedules into proper shape for tabulation.

agents were appointed to collect the schedules relating to Commerce and the Fisheries. The information relating to Schedule Nos. 7 and 8 (Libraries and Schools) was obtained largely by mail, supplemented by a small amount of special agency work. The following special agents were employed in a supervisory capacity on different branches of the field work:

On Population (examination and supervision of enumerators, etc.): Abercrombie, Frank S.; Berlyn, Morris; Chadwick, John C.; Downs, Harry F.; Doherty, Edward W.; Drown, Lowell A.; Grundy, William G.; Hoxie, David E.; Huntington, Edward W.; Kimball, Edward F.; Moore, Charles C. L.; Peck, L. V. N.; Richardson, George P.; Sanford, Frank L.; Sanford, H. Frank; Taylor, Joseph E.; Thompson, Charles.

On Agriculture: Moore, Charles C. L.; Thompson, Charles; Chief Special Agents. Abercrombie, Frank S.; Berlyn, Morris; Downs, Harry F.; Drown, Lowell A.; Sanford, Frank L.; Taylor, Joseph E.; Special Agents in Charge.

On Manufactures: Grundy, William G.; Special Agent in Charge.

The general field work in the collection of the schedules relating to Agriculture required 107 special agents, and for the collection of such schedules relating to Manufactures as were not promptly returned by mail 16 field special agents were employed. The limited amount of agency work required in the collection of the schedules relating to Libraries and Schools was performed by Mr. Charles E. O'Donnell, and that relating to the Fisheries and Commerce, by Messrs. Frank S. Abercrombie, Charles Thompson, Charles E. O'Donnell, George P. Richardson, Morris Berlyn, and George B. Willard.

After the schedules were received in the office they were carefully examined, all inconsistencies or seeming inaccuracies noted, and, by means of correspondence or otherwise, all necessary corrections made, in order to perfect them preparatory to the work of tabulation.

Methods of Tabulation.

The Massachusetts Bureau of Statistics of Labor was created in 1869. From that year until 1875, when the Bureau was first authorized to take the Census of the Commonwealth, all the computations required in tabulation, and all aggregations, were made by copying the figures from blanks or schedules into columns and adding the same in the ordinary way. In 1875, to facilitate the Census work, self-counting tally sheets were introduced and also a printed device, of a similar nature, for the aggregation of figures. This latter sheet was used in aggregating the statistics of manufactures, agriculture, etc., while the self-counting tally sheet was used for the statistics of population. It may be pointed out that the form of schedule used in the Massachusetts State Census of 1875, known as the family schedule, was identical in plan with the schedule used by the United States in 1890. In 1885, however, this form of schedule was abandoned in favor of a compact legible card

for each individual, such a card being successfully used in the State Censuses of 1885 and 1895. In 1885, the cards comprising Schedule No. 1 were printed in blue for males, and in red for females. In 1895, a yellow card was used for the inquiries relating to the families as a whole, a blue card for males, and a red card for females, all printed in black ink.

The form of schedule has influenced the methods of tabulation and aggregation. In 1882, machinery was first used in the Bureau for such work. As the figures could be aggregated much more expeditiously by taking them from the schedules and transferring them to a machine which gave the total, the old plan of copying the figures into columns was naturally discontinued, and only the results were taken from the machine. In 1883, an electric adding machine, which has been in use in the Bureau since that time, was invented, and the Census of 1885 and the reports on the Annual Statistics of Manufactures for 1886 up to the present time have been tabulated by the use of that machine. In 1885, an automatic counting machine (by counting is meant tallying as distinguished from the addition of large numbers) was used successfully in the tabulation of the Census returns for population. These returns were made upon cards eleven inches long and four inches wide, printed upon one side of the card only. In 1895, the card was made exactly one-half that size, or five and one-half by four, and printed upon both sides. This gave the same space for recording answers, but reduced the space required for packing one-half. It also brought about certain changes in the method of tabulation, and an improved automatic counting machine, used in tabulating the present Census, was the natural outcome.

It is not necessary to explain in detail the peculiar devices and methods employed in different branches of the work. The rapidity with which the work of tabulating has proceeded has increased from year to year by the adoption of these devices. In 1875, by the use of a self-counting tally sheet, 2,500 points per day were, on the average, taken from the schedules, the maximum reached by the best clerks being 6,000. In 1885, the general average was pushed forward to 5,000 points each day, the maximum being 10,000; in tabulating the results of the Census of 1895, however, the average was raised to 10,500 points per day, the maximum reaching 17,500 points for seven hours' work by one clerk. Each point, of course, means a recorded fact drawn from the Census schedule.

All these machines, mechanical devices, and appliances for tabulation and aggregation have been invented and successfully applied by the present Chief Clerk of the Bureau, Mr. Charles F. Pidgin, who has been connected with the department since 1873, and in their entirety comprise the Pidgin System of Census tabulating devices.

The Clerical Force.

The total number of different clerks employed upon the work, not including the permanent first and second clerks of the Bureau, is 145, nearly all of whom were new appointees selected through the Civil Service Department, after competitive examination under the provisions of the civil service law. The average length of employment was 25 months. Nearly all the clerks in charge of the different clerical divisions, with their immediate assistants in charge, were previously in the regular Bureau service. Some, however, were promoted from among the new appointees after experience had been gained in the work.

The Clerks in Charge, with their assistants, were as follows:

Clerks in Charge.	Assistants.	Designation of Divisions.
Bate, Miss Lena B.,	Brooks, Miss E. S.,	Tabulation and copy on Agriculture; also certain branches of Social Statistics of Population.
Evans, Miss Ethel F.,		Certain branches of Social Statistics of Population.
Foster, Miss A. Louise,	Brooks, Miss E. S.,	Principal tabulation of Population and Social Statistics.
Flynn, Miss Anna L.,	Church, Miss E. C., Miles, Miss Grace G.,	Tabulation on Manufactures; also certain branches of Social Statistics of Population.
McBride, Miss Helen T.,	Brooks, Miss M. Alice,	Tabulation and copy on The Fisheries and Commerce; also certain branches of Social Statistics of Population.
Shea, Miss Margaret,	Remick, Miss Ina M., Walker, Miss C. Edith,	Copy on Manufactures, Schools, and Libraries; also tabulation on certain branches of Social Statistics of Population.
Tyler, Miss Maria L.,		Examination of schedules on certain branches of Social Statistics of Population.
Varney, Miss Hannah M.,	Brooks, Miss M. Alice, Scheufele, Miss K. L.,	Copy on Population and Social Statistics.

Publication of Results.

In previous State Censuses no publication of results has been made, except the announcement of population, until the completion of each volume of the reports. In order that the results of each section, comprising the statistics of independent subjects might be given to the public as soon as the tabulation was completed, it was provided that in this Census the volumes should be made up of parts, each of which should be published when completed.

The returns fall into two general classes: First, those in which the element of time of publication particularly affects their value, and secondly, those not less important, perhaps, but used chiefly as the basis of sociological studies respecting the condition of the people, or of historical comparisons relating to the growth or industrial importance of the cities and towns.

Of the first class, the results of the enumeration used in determining the representative and senatorial districts are first required. The

population details for the cities and towns and wards of cities, with numerical gains and losses, and percentages of increase or decrease, were given to the public August 16, 1895, within six weeks after the statutory date for closing the enumeration. This was much earlier than these results were ever before available, the corresponding announcement in 1885 not having been made until the third day of October. The remaining subjects were taken up, completed, and published in order of their immediate importance.

The principal details relating to the population, comprising Volume I of the Census series, were published in Parts during the year 1896, as follows:

Part 1. Population and Legal Voters — Population: By Towns, Alphabetically — Population for 1885 and 1895: Increase and Decrease. By Towns — Population and Sex — Population for 1885 and 1895: Increase and Decrease. By Sex. Issued April 23.

Part 2. Villages: By Towns — Villages, Sections, Etc.: Alphabetically — Censuses of Population: 1765–1895. Dates of Incorporation, Changes in Name, Area, Boundaries, Population, Etc., for Counties, Cities, Towns, and the State. Issued July 2.

Part 3. Polls and Voters — Political Condition. Issued August 17.

Part 4. Families — Rooms — Tenements — Dwelling Houses. Issued December 9.

Part 5. Native and Foreign Born — Color and Race — Conjugal Condition — Soldiers, Sailors, and Marines. Issued December 18.

The remaining principal details of population, comprising Volume II of the series, appeared in 1897, as follows:

Part 1. Native Born and Foreign Born; Color and Race; Conjugal Condition: By Sex and Age Periods — Ages. Issued July 1.

Part 2. Relation to Head of Family — Place of Birth. Issued July 29.

Part 3. Length of Residence. Issued December 1.

The statistics of Manufactures, comprising Volume V of the series, the collection of which was not begun until December 15, 1895, were published entire in 1898, Parts 1 and 2 giving the principal information by towns appearing June 16 and July 29, respectively, and Part 3, showing the statistics classified by industries, on October 27.

The statistics of Agriculture, The Fisheries, and Commerce, comprising Volume VI of the series, which were also collected in 1896, were mainly issued in 1898 and completed the following year, as follows:

Part 1. The Fisheries and Commerce. Issued September 28.

Part 2. Agricultural Products and Property: By Towns. Issued October 5.

Part 3. Agricultural Products: By Name. Issued December 30.

Part 4. Agricultural Products: By Name. Issued May 11, 1899.

Part 5. Agricultural Property: By Name — Farm Statistics. Issued December 7, 1899.

The details of Parent Nativity, forming Part 1 of Volume III, were published December 1, 1898, and those relating to Schools and School Property, Libraries and Reading Rooms, forming Part 2 of Volume III, on December 12. Part 3 of Volume III, relating to the Defective Social and Physical Condition of the people, was published September 2, 1899.

Part 1 of Volume IV, giving the classified occupations of the population, by sex and native and foreign born, by towns and wards of cities, was published June 3, 1899. The remaining sections relating to occupations, which were among the last details tabulated, appeared at different dates during the year 1900, the section relating to Employment and Unemployment, forming Part 1 of the present volume (Volume VII of the series), appearing September 6, 1899, while Part 2 was completed in 1900.

The general work of the Bureau, including the publication annually of a report on the Statistics of Labor and one comprising the Statistics of Manufactures, has been carried on while the Census work was in progress. It has been necessary, therefore, to arrange the different departments so that each might be advanced together. This has somewhat delayed the publication of the later volumes in their completed form. The usual delays encountered in printing, impossible to avoid without monopolizing the entire attention of the printers, which, of course, is out of the question; a fire, which destroyed certain stereotyped plates, thereby retarding publication for some weeks; and other unavoidable incidents have prevented an earlier issue of the final volume. Nevertheless, as will be seen from the dates cited, the principal sections of immediate interest, in point of time, were given to the public with more than ordinary promptness.

The employment of a larger office force might have hastened the work, but this would have required the training of a considerable number of inexperienced clerks whose employment would have been limited to a few months, and the expense would have been materially increased without correspondingly increasing the value of the results. Much of the work required is technical and some weeks of practice are required before satisfactory results can be obtained from those who have never been connected with it. The plan of retaining a limited number, whose skill and capacity have been developed by employment in successive stages of the tabulation, has been found upon the whole most satisfactory and most economical. The sections which have been latest to appear are those in which, more than in any other parts of the Census, the interest is not merely temporary or immediate. They relate to subjects of the highest importance in connection with social and industrial problems, and serve as a permanent basis for comparisons with past and future work along similar lines. Within reasonable limits, of course,

their value does not primarily depend upon the number of months, more or less, which elapse between the dates of collection and publication of the returns. Whenever published, they may be held to represent present conditions, and as such must stand until the field is again covered and similar results made public.

Heretofore in the published reports of the Census the analyses of the different subjects have been combined and presented apart from the tables in the opening pages of each volume. In the present series, however, the statistics relating to each subject have been directly followed by a complete analysis in text. This, it is believed, will promote the convenience of the reader, since the tables and explanatory text are brought together; and, since the different subjects have been separately presented in parts as fast as completed, the analyses have been more thoroughly prepared than under the arrangement previously observed.

Acknowledgments.

To the Special Agents of the Department engaged on the work, to the members of the clerical force generally, and particularly to those in supervisory charge, my thanks are due for their faithful and meritorious performance of duty.

The Second Clerk of the Bureau, Mr. Frank H. Drown, besides general office work as exigency demanded, has had direct charge of the Division of Manufactures. In the preparation of the schedules for this important department, the supervision of the special agents engaged in the field work, and the direction of the office force engaged in the preparation of copy and revision of proof required for the volume relating to this subject, Mr. Drown's services were exceedingly efficient and merit my special acknowledgment. His experience, gained through long familiarity with the statistics of the industries of the Commonwealth, has rendered him expert in this branch, and has materially contributed to the completeness and accuracy of the results.

Mr. Charles F. Pidgin, First Clerk, has throughout had immediate charge and oversight of the entire office force engaged in tabulation. In the preparation of the general schedule forms, with the instructions to the enumerators for filling the same, and in devising the scheme forms for tabulation, including the adaptation of mechanical appliances and processes therefor, he has rendered invaluable assistance, and by the practical skill which he has brought to bear upon the work the completeness of the statistical presentations has been enhanced and the rapidity of the tabulation promoted. It is no slight task to reduce to manuscript in form for printing the wide range of figures collected in the Census, and to arrange the work of tabulation so that the various aggregations and correlations may be rapidly and correctly made. The expense of performing office work of this kind is necessarily considerable, and if skilled methods are not employed large amounts may be wasted. Mr. Pidgin's

long experience in this branch of the service, with his minute and definite knowledge of the processes to be used in shortening the time required to finish the work without impairing its completeness, has operated to reduce the expense to the minimum. The Commonwealth has incurred no pecuniary obligation in the way of royalties for the use of devices of his invention which have materially contributed to this result, and it is proper that the character of the service which he has rendered should be especially mentioned here. I also take pleasure in recording my personal acknowledgments to him for his faithful and continuous assistance throughout the progress of the work, rendered at all times with entire devotion to the duties of his position, without limitation to set office hours and often without availing himself of the usual vacation, with the single purpose of promoting the efficiency of the Department.

HORACE G. WADLIN,
Chief.

Bureau of Statistics of Labor,
State House, Boston,
December, 1900.

EMPLOYMENT AND UNEMPLOYMENT.

EMPLOYMENT AND UNEMPLOYMENT.

The statistics relating to Employment and Unemployment comprise two tables, both presenting facts for each of the cities and towns in the Commonwealth. The first table begins on page 5 and closes on page 91; the second begins on page 90 and closes on page 103.

In the first table the following facts are shown for each city and town: First, the number of males and females employed at their regular occupation for each month of the Census year. The Census year began on May 1, 1894, and ended April 30, 1895. It will be seen that the Census year so-called included eight months in the year 1894 and four months in the year 1895. The term "regular" employment does not mean continuous employment, but employment in the occupation upon which the persons principally depended for a livelihood. The next fact presented is the number of males and females engaged in "other employment," meaning by that term, employment in occupations other than the principal ones upon which they depended for a living. The next fact shown is the total number of males and females employed, being the sum of the two items previously presented. The next fact shown is the number of males and females unemployed. The remaining lines show the number of males and females to whom the inquiry as to employment and unemployment was deemed inapplicable.

In this table, as stated in the head-note on page 5, full face type is used to indicate the month or months in which the greatest number of persons was employed (see figures opposite the line "Total employed"), the smallest number of persons employed being indicated in a similar manner by the use of italic type.

The term "inapplicable" requires full and careful explanation in order that its meaning may be clearly understood. The question of employment and unemployment is of particular interest to those whose work is of such a nature that their failure to obtain employment means permanent loss of pay. But there are many persons engaged in gainful occupations, who, although they may suffer financially during periods of idleness, nevertheless, are able to recover this loss, in whole or in part, during periods of activity. The person who works for a fixed wage for a definite number of hours' service, however, has no opportunity to make up for lost time, except by overwork. There are other persons engaged in gainful occupations who may be unemployed or partially employed from time to time on account of business depression or for other reasons but who do not suffer entire diminution of income owing to the nature of their occupation.

A careful inspection of the list which follows will show that the distinction noted has determined the applicability of the inquiries as to employment and unemployment. Under Government, the inquiries have been considered inapplicable as regards the following occupations: Consuls, members of congress, postmasters, officers (army), officers (navy), and mail contractors (employers).

The professional class has nine subdivisions, including many to whom the inquiries have been considered as inapplicable. Under religion there are clergymen, evangelists, mediums, members of religious societies, missionaries, preachers (Quakers), and priests; under law, conveyancers, lawyers, notaries public, etc.; under medicine, chiropodists (employers), clairvoyants, dentists (employers), manicures, midwives, physicians, and surgeons; under literature, authors, editors, genealogists, historians, interpreters and translators, journalists, and lecturers; under art, artists and sculptors; under music, composers, leaders of bands, musicians, music teachers, organists, and singers; under amusements, actors, athletic sports (professional), baseball players and managers, bicyclists (professional), elocutionists, horse trainers and drivers, and showmen; under education, officials (colleges and museums), professors, proprietors and principals of seminaries, etc., superintendents of schools, teachers, and tutors; under science, architects, divers (employers), inventors, and scientists.

Under the remaining classes of occupation the inquiries have been considered inapplicable to the employing and proprietary classes generally as follows: Under Domestic Service to boarding-house keepers, hotel keepers, housewives and those engaged in housework, lodging-house keepers, restaurant keepers, and saloon keepers.

Under Personal Service to barbers (employers), billiard and pool room proprietors, caterers, cleansers and renovators (carpets, clothing, etc.), fortune tellers, horse clippers, keepers (employment offices), laundry proprietors, officials (societies), proprietors (places of amusement), proprietors of street sprinklers and private baths, scissors grinders, umbrella and parasol menders, and undertakers (employers).

Under Trade to auctioneers, bankers, brokers, butchers (employers), capitalists, collectors-junk (employers), contractors, executors, trustees, etc., importers, marketmen (employers), merchants and dealers (all kinds), peddlers, presidents of banks, speculators, traders, and traders and shippers (cattle).

Under Transportation to contractors (steam roads), expressmen (employers), officials (steam roads), proprietors (boarding, livery, and other stable service), proprietors (cab, carriage, hack, and omnibus service), proprietors (carriers on seas and rivers), proprietors (storage warehouse), and teamsters (employers).

Under Agriculture to farmers, florists (employers), gardeners (employers), poultry raisers (employers), and stock breeders and raisers.

Under The Fisheries to fishermen (employers), and proprietors (fish ponds and weirs).

Under Manufactures to all manufacturers (employers) and all employers engaged in mechanical industries.

Under Mining to contractors, mining company officials, and proprietors of mines and quarries.

In the case of persons included under the class headings Scholars, Students, Retired, Not Gainful, etc., Not Productive, Dependents, At Home, and Not Stated, the questions as to employment and unemployment have been considered inapplicable to the entire class, as none of them belong to the producing or money-earning section of the community.

The first table should be read as follows: In the town of Barnstable we find the number of males engaged in their regular employment in the month of May, 1894, to be 824, and the number of females thus employed 138, making a total for both sexes of 962. In the month of June this total had increased one, amounting to 963; in July the number had fallen 23 to a total of 940; August shows a still further decline of 34, or a total of 906. The figures for each month may be read in a similar manner. Taking the line "Total employed," and noting the full face type, we see that the largest number employed was in the months of May, June, and July, 1894; the smallest number employed being found in the month of January, 1895, as indicated by the italic type. These figures present a consolidated monthly and yearly report, for each city and town, and being based upon individual returns made by each person, are thought to be more indicative of industrial conditions for the times and places specified than could be derived from returns made by manufacturers or other employers of labor.

The second table should be read as follows: In the town of Barnstable in the Census year as previously explained, the greatest number employed is found in the months of May, June, and July, the smallest number employed being in the month of January, the comparative decrease for the year amounting to 76. The second section of the table relates to Unemployment, and shows that the smallest number unemployed was found in the months of May and June, the largest number unemployed being found in the month of January, and the comparative increase in unemployment during the year amounting to 77.

The third section of the table on page 91 shows that for the town of Barnstable the persons employed continuously during the Census year numbered 751, the number unemployed continuously during the Census year six, and the number irregularly employed during the Census year, 256. The aggregate of these three items is 1,013, which represents the number of persons covered by the inquiry. The number of persons to whom the inquiry in relation to employment and unemployment was deemed inapplicable was 3,042, and these two items combined comprise the population of the town, namely, 4,055.

Brought to the basis of percentages of total population, the number of persons covered by the inquiry is represented by 24.98 per cent, and the inquiry was considered inapplicable for 75.02 per cent. The percentage of persons continuously employed during the Census year was 74.14, the percentage unemployed continuously, 0.59, and the percentage irregularly employed, 25.27. These figures were based upon the number of persons covered by the inquiry, and not upon the total population.

In the towns of New Ashford and Greenwich the number of persons employed was the same in each month of the Census year, showing that there were no fluctuations in employment during that period in these towns.

EMPLOYMENT AND UNEMPLOYMENT: BY MONTHS OF THE CENSUS YEAR.

COUNTY OF BARNSTABLE.

[The month or months in which the greatest number of persons was employed (see figures opposite the line "Total employed") are indicated by the figures in **full face** type; the smallest number of persons employed is indicated in a similar manner by the use of *italic* type. The Census year covered the 12 months preceding May 1, 1895.]

TABULAR ANALYSIS.

Pages
EMPLOYMENT AND UNEMPLOYMENT, ... 1–103

General Remarks.

The statistics relating to employment are among the most important data obtained in the Census. As they are secured in a house-to-house canvass, they include the entire population to which questions relating to employment properly apply, and enable us to determine the exact amount of enforced idleness which may exist within the months covered by the Census. Thus the returns furnish a statistical basis for the proper study of the important industrial problem of unemployment.

The subject was first included in the Massachusetts Census of 1885, and the results published as a monograph in the annual Report of the Bureau for 1887. Similar inquiries were made in the National Census of 1890, and the results duly published in the Census report. In 1895 the questions were broadened so as to bring out for the first time in any census the number employed in the aggregate month by month, and the time the persons were employed in occupations other than those usually pursued, as well as the time actually idle.

The persons to whom the questions have been considered to apply are, in general, all persons earning wages or salaries, whose income is directly dependent on active employment. They do not cover professional persons or the proprietary and employing classes, whose active employment is from its nature not continuous, or whose incomes are from profits or emoluments which are either not cut off by the cessation of active employment, or can be enlarged during periods of activity so as to offset periods of depression. The distinction here generally made is explained in detail in the note on pages 2 and 3, *ante*, which sets forth fully the classes excluded from the terms of the inquiries.

The Results for the State at Large.

The recapitulation on pages 90 and 91 summarizes the figures for the State. It may be seen that the largest number of persons employed in any single month was employed in the month of April, the aggregate being 879,307; on the other hand, the smallest number, namely, 816,197, was employed in the month of August. The number of unemployed persons in the month of April was 43,301, and the number of unemployed persons in August was 86,089. Of the number employed in April, 864,248 persons were engaged in their usual occupations, classified in the table as "Regular employment," and 15,059 were engaged in employment other than their usual occupation. In the month of August, 786,802 persons out of the total number employed were engaged in their usual employment and 29,395 in other employment.

The important facts as to employment cannot be readily seen, however, from an inspection of these figures. To grasp them it is necessary to make use of percentages in order that their relations with one another may be clearly brought out. For this pur-

pose we refer to the recapitulation on pages 102 and 103. In this recapitulation the line for the State brings forward the number of persons employed and unemployed at the time of employment of the greatest and smallest numbers, respectively, and shows that the decrease in persons employed, brought out by comparing the minimum with the maximum number, was 63,110. On the other hand, with respect to unemployment, the increase in the unemployed persons shown by the maximum as against the minimum is 51,209. The recapitulation also shows that out of the entire population of the State, 2,500,183, the inquiry relative to employment, subject to the restrictions which we have previously noted, was inapplicable during the Census year to 1,574,402 persons; hence 925,781 persons were covered by the inquiry. Of these persons, 252,456 were irregularly employed during the year, that is, their employment was not continuous, but was subject to periods of unemployment of greater or less length; 8,339 persons were unemployed during the entire year; and 664,986 persons were employed continuously during the year. Expressed in terms of percentages, 37.03 per cent of the entire population was covered by the inquiry; that is, this percentage represents the section of the population to which the questions were applicable, comprising persons in gainful occupations, whose remuneration was subject entirely to their active employment, as previously explained. Of the persons to whom the inquiry applied, nearly 72 in every 100 (71.83 per cent) were employed continuously during the Census year, and less than one in every 100 (0.90 per cent) was out of employment during the entire year. The persons who were irregularly employed, that is, whose employment was subject to fluctuations and was broken by periods of unemployment of greater or less length, numbered about 27 in every 100 (27.27 per cent).

Two points are significant in this statement; first, that notwithstanding the extreme business depression which was felt in Massachusetts in the Census year, it was nevertheless true that the persons who were unemployed for a period of 12 months represent only a fractional percentage of the population in gainful occupations, this unemployment being due, of course, to various causes besides the mere inability to obtain work, for example, among others to illness; and nearly three-fourths of the entire number in gainful occupations were continuously employed during the year. Secondly, about 27 persons in every 100 were subject to fluctuating employment. It is these last mentioned persons who really form an important class in considering the problem of the unemployed. It is generally held that the number of such persons is constantly increasing; that, for example, they form a very much larger proportion of the persons engaged in gainful occupations than was the case 10 years ago. It is possible to supply comparative figures upon this point by means of the returns of the Census of 1885.

We bring forward in the following table the figures for the State as determined for 1895 and also similar figures from the preceding Census.

It should be stated, however, that in 1885 the inquiries were applied to all persons in gainful employment without the distinction observed in 1895 which we have mentioned, and which is explained in detail in the note on pages 2 and 3, *ante*. They therefore covered a larger percentage of the population in 1885 than in 1895. But the slight difference in the percentage of the population covered (42.08 in 1885 as against 37.03 in 1895) does not, it is believed, affect the general result of the comparison.

The State.	Number of Persons —						Percentages of Persons covered by the Inquiry			Percentages of Population	
	Employed continuously during Census Year	Unemployed continuously during Census Year	Irregularly Employed during Census Year	Covered by the Inquiry	To whom the Inquiry was Inapplicable during Census Year	Population	Employed continuously during Census Year	Unemployed continuously during Census Year	Irregularly Employed during Census Year	Persons covered by the Inquiry	Persons to whom the Inquiry was Inapplicable during Census Year
Census of 1885,	575,719	822	240,767	817,308	1,124,833	1,942,141	70.44	0.10	29.46	42.08	57.92
Census of 1895,	664,986	8,339	252,456	925,781	1,574,402	2,500,183	71.83	0.90	27.27	37.03	62.97

Summarizing the results of the comparison, which is made possible by the preceding table, it will be seen that the percentage of persons irregularly employed in 1885 was 29.46 as against 27.27 in 1895. Instead of increasing, therefore, this percentage shows a decline in the latter as compared with the former year. The percentage of persons continuously unemployed shows an increase from 0.10 to 0.90. This is due, undoubtedly, to the peculiar conditions which obtained in the year 1895, due to the extreme business depression in that year. The percentage of persons continuously employed, on the other hand, is 71.83 in 1895 as against 70.44 in 1885.

The Results in the Cities.

We present a series of tables relating to the cities as a whole, and to certain cities and towns engaged in particular industries. The first table of the series relates to the cities, without regard to the particular industrial conditions which belong to them, respectively.

If the reader will bear in mind that the percentage of persons irregularly employed, that is, subject to fluctuating employment, in the State at large, as shown in the recapitulation, pages 102 and 103, is 27.27, it will be seen from the preceding table that this percentage is exceeded in the following cities, the percentage of persons irregularly employed being in each case annexed: Brockton, 35.30; Fall River, 62.63; Fitchburg, 34.43; Haverhill, 38.92; Lynn, 30.68; Marlborough, 32.14; New Bedford, 46.76; Pittsfield, 28.32; Quincy, 33.58; Salem, 30.31; Waltham, 30.54; Woburn, 28.69. A strike of cotton mill operatives in Fall River in the summer of 1894 accounts in part for the exceptionally high percentage shown in that city.

Not only does the percentage of persons irregularly employed in these 12 cities rise above that for the State, but the percentage of persons continuously out of employment during the Census year, in seven of them, and in 11 other cities, is above that shown for the State as a whole. Such cities are the following, the percentage of persons continuously unemployed being annexed in each case: Beverly, 0.94; Boston, 1.22; Cambridge, 1.08; Chelsea, 1.51; Everett, 1.42; Fitchburg, 0.97; Holyoke, 1.13; Lynn, 1.28; Malden, 0.91; Marlborough, 1.17; New Bedford, 1.27; Quincy, 1.59; Somerville, 0.91; Springfield, 0.95; Taunton, 1.33; Waltham, 1.69; Woburn, 1.17; Worcester, 1.55. In Brockton, Fall River, Haverhill, Pittsfield, and Salem, although the percentages representing persons subject to fluctuating employment are comparatively high, the

percentages representing persons continuously out of employment are below the corresponding percentages for the State at large.

In the city of Boston, which has varied industrial interests, and which is subject to other conditions than those directly pertaining to manufacturing, the percentage of persons irregularly employed during the year was but 18.25; on the other hand, as just cited, 1.22 were unemployed continuously during the 12 months. It is significant, however, that in Boston during the 12 months of the Census year nearly 81 persons in every 100 (80.53 per cent) were continuously employed during the year. Other cities which show a high percentage of persons continuously employed are the following, the percentage in each case being annexed: Beverly, 78.53; Cambridge, 78.36; Chelsea, 80.74; Chicopee, 80.83; Everett, 78.75; Gloucester, 85.85; Lawrence, 80.08; Malden, 83.24; Medford, 79.44; Newton, 81.71; North Adams, 76.66; Northampton, 77.04; Somerville, 80.01; Springfield, 77.06; Taunton, 75.26; Worcester, 75.39. Many of these cities are closely connected with Boston, and persons who reside in them are employed in Boston. They therefore share in the favorable conditions which evidently made employment on the whole more general in Boston than in some of the outlying cities which depend entirely upon their local industries. The city of Worcester, however, which is included among them, is a city of varied industries, and for that reason suffered less from the depression than some of the cities and towns which were obliged to rely largely upon a single industry.

The Results in the Principal Cities and Towns engaged in the Textile Industries.

The next table in the series relates to cities and towns in which the principal employment is furnished by the textile industries.

In the cities and towns largely devoted to the production of textiles the effect of the industrial depression was severely felt, and high percentages of persons not continuously employed are found in them. In the city of Fall River, for example, this percentage as we have seen rises to 62.63. This means that nearly 63 persons in every 100 in Fall River during the 12 months covered by the Census year were subject to fluctuating employment, and, as a corollary of this, only about 37 persons in every 100 (36.97 per cent) were employed continuously during the Census year. Nevertheless, only a fractional percentage, 0.40, was unemployed continuously during the year. The percentage of persons irregularly employed is higher in Fall River than in any other city, as may be seen by referring once more to the table in which all the cities are grouped, and we have there stated that this was due in part to exceptional conditions brought about by a strike in that city during the Census year. Other textile places in which high percentages appear are New Bedford, 46.76; Fitchburg, 34.43; and North Andover, 33.72.

In some of the municipalities included in the textile group this percentage is comparatively low however, due no doubt to the presence of other industries in such places, which have affected the conditions relating to employment when applied to the whole number of persons gainfully employed. For example, in Lawrence it is but 19.45, and in Lowell it is 25.39, a percentage slightly less than that shown for the State as a whole. In North Adams and in Taunton also, the percentages being, respectively, 23.13 and 23.41, the percentage shown for the State is not equalled.

The Results in the Principal Cities and Towns engaged in the Manufacture of Boots and Shoes.

The next table relates to the cities and towns in which the manufacture of boots and shoes is important.

A single glance at the percentages of persons irregularly employed in the boot and shoe towns will show that in nearly all of these places the percentage is higher than for the State, and takes a uniformly high range. This is due, no doubt, to the periods of seasonal depression in the boot and shoe industry. In Haverhill, 38.92 per cent, or nearly 39 persons in every 100, were irregularly employed; in Brockton, 35.30 per cent; in Marblehead, 47.65 per cent; in Middleborough, 49.73 per cent; in Milford, 46.31 per cent; in Spencer, 48.34 per cent. In Lynn, which is a leading boot and shoe city, the percentage does not rise quite so high, being 30.68, and is exceeded in many of the smaller places. In Middleborough 2.66 per cent, and in Randolph 2.93 per cent of the persons covered by the inquiry were continuously unemployed during the year. These two percentages are very high.

The Results in the Principal Cities and Towns engaged in the Manufacture of Paper and Paper Goods.

The next table relates to the cities in which the manufacture of paper and paper goods is the principal industry.

Cities and Towns.	Persons Employed					Persons Unemployed				
	Greatest Number		Smallest Number		Comparative Decrease (—)	Smallest Number		Greatest Number		Comparative Increase (+)

Cities and Towns.	Number of Persons—						Percentages of Persons covered by the Inquiry			Percentages of Population	
	Employed continuously during Census Year	Unemployed continuously during Census Year	Irregularly Employed during Census Year	Covered by the Inquiry	To whom the Inquiry was Inapplicable during Census Year	Population	Employed continuously during Census Year	Unemployed continuously during Census Year	Irregularly Employed during Census Year	Persons covered by the Inquiry	Persons to whom the Inquiry was Inapplicable during Census Year
Dalton, . .	954	2	368	1,324	1,886	3,210	72.05	0.15	27.80	41.25	58.75
Holyoke, . .	11,796	184	4,301	16,281	24,041	40,322	72.45	1.13	26.42	40.38	59.62
Lee, . . .	1,000	8	407	1,415	2,651	4,066	70.67	0.57	28.76	34.80	65.20
Springfield, .	14,456	179	4,125	18,760	32,762	51,522	77.06	0.95	21.99	36.41	63.59
WestSpringfield,	1,883	2	274	2,159	3,966	6,125	87.22	0.09	12.69	35.25	64.75

In the cities and towns included in the foregoing group, except Dalton and Lee, the percentage of persons irregularly employed during the year is less than for the State at large, and in Dalton it is practically the same as for the State, being 27.80. In Lee it rises to 28.76 per cent. Upon the whole, however, employment was evidently subject to less fluctuation in these cities and towns than in some others.

The Results in the Principal Cities and Towns engaged in the Leather Industry.

The next table relates to one city and two towns in which the leather industry is important.

Cities and Towns.	Persons Employed					Persons Unemployed				
	Greatest Number		Smallest Number		Comparative Decrease (—)	Smallest Number		Greatest Number		Comparative Increase (+)

Cities and Towns.	Number of Persons—						Percentages of Persons covered by the Inquiry			Percentages of Population	
	Employed continuously during Census Year	Unemployed continuously during Census Year	Irregularly Employed during Census Year	Covered by the Inquiry	To whom the Inquiry was Inapplicable during Census Year	Population	Employed continuously during Census Year	Unemployed continuously during Census Year	Irregularly Employed during Census Year	Persons covered by the Inquiry	Persons to whom the Inquiry was Inapplicable during Census Year
Peabody, . .	2,789	37	867	3,693	6,814	10,507	75.52	1.00	23.48	35.15	64.85
Winchester, .	1,621	16	434	2,071	4,079	6,150	78.27	0.77	20.96	33.67	66.33
Woburn, . .	3,423	57	1,400	4,880	9,298	14,178	70.14	1.17	28.69	34.42	65.58

The municipalities included in this table are Peabody, Winchester, and Woburn. In Woburn the percentage of persons irregularly employed is slightly higher than for the State at large, being 28.69. In both Peabody and Winchester, however, the percentages are less than for the State at large, being respectively, 23.48 and 20.96. To put the matter from the opposite standpoint: In Peabody, 75.52 per cent of the persons employed in gainful pursuits, to whom the inquiry was applicable, were continuously employed during the Census year; in Winchester, 78.27 per cent; and in Woburn, 70.14 per cent.

The Interpretation of the Percentages.

Merely to state that a given number of persons in every 100 was subject to fluctuating employment during the year, and that is what these percentages mean, does not tell the whole story. Such percentages may convey a very misleading impression as to the severity of the problem of unemployment if used without taking into account other essential factors in the case.

The Bureau is preparing a special analysis of the figures in detail, by occupations, which, when completed, will be issued in its quarterly Bulletin, showing among other details how many of the persons subject to fluctuating employment, i. e., not continuously employed for 12 months, were employed for 11 months, 10 months, nine months, and so on through the year. In the absence of such details, which due regard for the size of this volume obliges us to omit here, the figures showing the aggregate number of persons employed month by month are sufficiently indicative to prevent the erroneous impression which may possibly be given by the percentages alone.

For example, as the exceptional conditions obtaining in Fall River have been mentioned, reference to the tabular statement for that city contained upon page 18, showing the total number of persons employed therein during each month, brings out the fact that although the range of employment extends from 19,913 in September, 1894, to 38,561 in April, 1895, nevertheless, except for the months of August, September, and October, 1894, employment was very uniform, the number employed not dropping below 33,441, as returned for the single month of July, 1894. The three months named felt the influence of a strike which began in August and was not ended until late in October. Excluding the three months, August, September, and October, 1894, the total number of persons employed for the other months was as follows: May, 1894, 37,336; June, 37,007; July, 33,441; November, 36,104; December, 36,031; January, 1895, 36,335; February, 36,811; March, 37,688; April, 38,561. The average number for these nine months based upon these figures is 36,590. The preceding analysis table for cities has shown that the total number of persons to whom the inquiry relative to employment was applicable was 39,859. The average number employed for the nine months mentioned was, therefore, 91.80 per cent of the number covered by the inquiry; hence, although 62.63 per cent of the number to whom the inquiry applied did not have continuous employment, yet the figures point to the employment of many of these persons for at least nine months.

Applying a similar analysis to the figures for the State at large, we note that as shown by the table pages 90 and 91, the number of persons employed month by month ranges from 816,197, the number employed in August, 1894, the month showing the employment of the smallest number, to 879,307 in April, 1895, the month showing the employment of the largest number, indicating that notwithstanding the percentage of persons subjected to fluctuating employment, the periods of unemployment covered in many cases a comparatively limited time.

The Months in which Employment is least.

The presentations relating to this subject not only show the fluctuations in employment which occurred in a year of unusual depression in the different cities and towns but the table, pages 90 to 103, also brings clearly before the reader the months in which the smallest number of persons was employed or unemployed, and it is probable that in any year, under present industrial conditions similar relative conditions would be found.

In the textile cities and towns, January was the month in which the smallest number was employed in Pittsfield and Taunton; April in Dudley, Fitchburg, Lowell, New Bedford, and North Andover; February in North Adams; July in Lawrence; and September in Fall River.

In the boot and shoe cities and towns, January was the month in which the smallest number of persons was employed in Braintree, Marblehead, Marlborough, Natick, and Randolph; February in Athol, Brookfield, Haverhill, Hudson, Stoughton, and Whitman,

and January and February in Stoneham; April in Framingham, Middleborough, Milford, Rockland, Spencer, and Webster; July in Abington and Danvers; December in Beverly, Brockton, Lynn, Newburyport, Salem, and Weymouth.

In the cities and towns engaged in the manufacture of paper, December was the month in which the smallest number was employed in Dalton, Springfield, and West Springfield; January in Lee; and September in Holyoke.

In the cities and towns engaged in the manufacture of leather, December shows the smallest number employed in Peabody and Woburn, and January in Winchester.

In Boston, the smallest number was employed in January, and the same statement applies to Cambridge, Chelsea, Everett, Gloucester, Malden, Marlborough, Medford, Newton, Pittsfield, Quincy, Somerville, and Taunton. In Worcester, December found the smallest number employed, and this statement applies also to Springfield, Northampton, Beverly, Brockton, Lynn, Newburyport, and Salem.

Scholars and Students: By Towns. With Sex and Descent.

SCHOLARS AND STUDENTS: BY TOWNS. WITH SEX AND DESCENT.

In the Census, the act of obtaining an education at a public or private school, or at a college, academy, etc., was considered as an occupation. The information was secured by a house-to-house canvass made by the enumerator, and shows the number of persons residing in the State on May 1, 1895, who were reported as attending a public or private school, or a college, academy, seminary, etc. These figures are not necessarily limited to those children within the recognized school age, but include also young persons, or even adults, who were found continuing or completing their education. Wherever an arbitrary decision was required between scholars and students, those above 18 years of age were classed as students.

In the tabular presentation, the number of scholars in the public schools, scholars in the private schools, and students, is shown by sex for each city and town, and in a county and State recapitulation, together with a specification of those native born of native descent, native born of foreign descent, and foreign born.

As stated above, the figure showing the number of scholars in public and private schools in any city or town cannot be directly compared with the number of persons within the recognized school age in that town, nor with the number of scholars reported as attending public schools, for it is undoubtedly true that a great many pupils returned as attending public schools should have been included among those in private schools.

ILLITERACY.

Illiteracy: By Towns.

With Sex and Descent.

ILLITERACY.

In order that the tables hereinafter presented in relation to illiteracy may be thoroughly understood, we supply the bases upon which the information was secured, as contained in the instructions given to the enumerators who collected the information.

In the first place, the inquiries relating to illiteracy were made only regarding those persons 10 years of age and over. For example, if a person could both read and write English and was 10 years of age or over, the enumerator reported that the person could both read and write English; if a person could read or write in French or in any other foreign language, but not in English, the particular language was reported. If a person could both read and write English, the enumerator was instructed to make no further inquiry. It was only in the case of those persons who could not read and write English, but who could read or write some other language, that the inquiries were continued until the desired information was secured. If a person could read in English or a foreign language, but could not write that language, the enumerator reported that he could read but could not write; if a person could write in English or a foreign language, but could not read in that language, the enumerator reported that he could not read, but could write; if he could not read or write in English or any other language, the enumerator reported that he could neither read nor write, or was totally illiterate.

There are four distinct presentations given hereinafter relating to the subject of illiteracy.

The first table shows, by sex, the number of illiterates in each city and town, together with a county and State recapitulation, and a specification of those native born of native descent, native born of foreign descent, foreign born, foreign born, naturalized, and foreign born, alien. It is evident that all the native born persons are included under one or the other of the headings, "Native born, native descent," or "Native born, foreign descent." In the case of the foreign born, the columns headed "Foreign born, naturalized," and "Foreign born, alien," obviously relate only to those male persons 21 years of age and over, while the column headed "Foreign born" would naturally include all the females, all males under 21 years of age, and those who could not be properly classified under the headings "Foreign born, naturalized," and "Foreign born, alien."

The figures indicating the population 10 years of age and over in the various cities and towns have been compiled from the age tables of the Census, excepting in the case of the 13 sections of the city of Boston, where this figure has been secured by an estimate, as the exact ages of the population in those 13 sections were not separately tabulated in the Census.

In the second table is shown, by sex and age periods, the number of illiterates in each city and town, with a specification of the degree of illiteracy; that is, the respective numbers who could not read, could not write, or could neither read nor write. The age periods have been made to compare as closely as possible with those used in the State Census of 1885.

The third table shows by sex, for each city and town, the number of illiterates according to the Censuses of 1885 and 1895, together with the proportional population 10 years of age and over to each illiterate in the Census year specified.

The fourth table shows the number of illiterates, without distinction of sex, for each city and town in the Commonwealth, in each class of occupations, including those employed by the government, in professional life, engaged in domestic or personal service, trade, transportation, agriculture, the fisheries, manufactures, mining, laborers, and children at work These are the productive or gainful classes of occupations. Besides these, the illiterates among the retired and dependent are also given.

The fact will be noticed that illiterate scholars are reported in some cases, but it should be borne in mind that scholars in public institutions, who are classed as being in the public schools, are included, and although at the date of enumeration they were considered as scholars, they had not received sufficient education to remove them from the illiterate class, but this disability has undoubtedly been removed by subsequent instruction in those institutions.

ILLITERACY: BY TOWNS. WITH SEX AND DESCENT.

ALL OCCUPATIONS.

RECAPITULATIONS

FOR THE STATE AND COUNTIES.

ALL OCCUPATIONS. RECAPITULATIONS. FOR THE STATE AND COUNTIES.

Under "Classified Occupations: By Towns," presented in Vol. IV of the Census series, will be found a statement for each city and town showing the number of males and females, respectively, in each of the 22 classes of occupations.

The explanation of the presentation "All Occupations: By Towns," given in the note on pages 161-167 of Vol. IV, and relating to the counties of Barnstable, Berkshire, Bristol, and Dukes, is equally applicable to the presentation which follows, relating to the State and counties at large, and the reader should refer to the same in order to understand fully the method of presentation and the reasons for giving the statistics in the manner selected.

Under each class, as explained in the note previously referred to, are "Sections," by which are meant the principal subdivisions under each class, which are usually called industries. Under each section are further subdivisions called "Detail," which are in reality the minor subdivisions of industries, usually called branches of occupation. To learn the number of sections and details under each class, it will be necessary to refer to the note on pages 161-167, Vol. IV.

In the first presentation in Vol. IV, "Classified Occupations: By Towns," the number in each class, with specification of sex, is given, but no further information is supplied. In the presentation "All Occupations: By Towns," and in the first recapitulation which follows, the information supplied is much more complete. We have first the classification by general classes and by section heads, under separate classifications by sex for the State. Besides the number of persons in each class and section, with sex specification, we have in addition four classifications by age periods, four by length of residence in the United States, and also a column indicating the number of illiterate persons employed in the specified section. For instance, if we turn to page 245, *post*, under the general class heading Manufactures we find the section heading Cotton Goods. Taking the line for males first we learn that the whole number of males employed in the manufacture of Cotton Goods in the State on May 1, 1895, was 39,614. Of these, 9,759 were 15 but under 20 years of age; 28,940, 20 but under 60 years of age; and 915, 60 years and over. The number of illiterates was 6,096. As regards length of residence in the United States, 1,593 had lived in the United States one year or less; 7,653, one year but under six years; 24,629, six years but under 30 years; 5,739, 30 years and over. Taking the line for females, on page 250, *post*, we find that the number of that sex employed in the manufacture of Cotton Goods in the State on May 1, 1895, was 39,167. Their ages, classified by age periods, were as follows: 12,404, 15 but under 20 years; 26,547, 20 but under 60; and 216, 60 years and over. The number of illiterate females employed in the manufacture of Cotton Goods was 5,065. As to the length of residence in the United States, 1,763 had lived in the United States one year or less; 7,606, over one year but under six years; 26,174, six years but under 30 years; and 3,624, 30 years and over.

These illustrations could be multiplied indefinitely, but they would not vary materially from the one just given. In a general way it may be stated that the presentation shows for each county as a whole the nativity and the number of males and females engaged in each of the classes and sections of occupations. It also shows for the State the number of males and females engaged in each of the sections or subdivisions under each of the general classes, with further specifications by age periods, length of residence, and number of illiterate persons in each of such classes or sections.

ALL OCCUPATIONS. FOR THE STATE.

Scholars and Students.

The detailed presentation relating to scholars and students appears on pages 115-146. The reader is referred to the note on page 117 for full information as to the method pursued in collecting the statistics. In general, the term "scholars" refers to pupils of public or private schools below the age of 18 years, while the designation "students" covers persons above the age of 18, attending colleges, academies, seminaries, etc. The scholars and students as thus classified are shown in the table by sex under three heads, native born of native descent, native born of foreign descent,* and foreign born. Information is given for cities and towns, with a recapitulation for the State and counties, which is presented on page 146.

Referring to this recapitulation, we note that the aggregate of scholars and students for the State for the Census year was 438,899, the number of students being 17,109. The number of scholars aggregates 421,790, of whom 369,168 were attending public schools, and 52,622 attending private schools. The following table brings forward these figures for the State with similar figures for cities as a whole, and for the towns as distinct from the cities, with percentages:

The State, and Kind of School.	Scholars							
	Numbers				*Percentages*			
	Native Born, Native Descent	Native Born, Foreign Descent	Foreign Born	Totals	Native Born, Native Descent	Native Born, Foreign Descent	Foreign Born	Totals
The State,	206,013	168,725	47,052	421,790	48.84	40.00	11.16	100.00
Public schools,	191,039	139,900	38,229	369,168	45.29	33.17	9.07	87.53
Private schools,	14,974	28,825	8,823	52,622	3.55	6.83	2.09	12.47

* The term descent as used in this and all other tables in this volume refers to the immediate descent, as indicated by the nativity of the father; that is, the descent of the person is not traced beyond the next preceding generation.

The State, and Kind of School.	Scholars							
	Numbers				*Percentages*			
	Native Born, Native Descent	Native Born, Foreign Descent	Foreign Born	Totals	Native Born, Native Descent	Native Born, Foreign Descent	Foreign Born	Totals

Private schools,	3,936	4,248	1,038	9,222	2.66	2.88	0.70	6.24

Inspection of the above table shows at once that of the total number of scholars attending school in the State in the Census year about 49 in every 100 (48.84 per cent) were native born of native descent; 40 in every 100 (40 per cent), native born of foreign descent, and about 11 in every 100 (11.16 per cent), foreign born. Of the entire number of scholars, nearly 88 in every 100 (87.53 per cent) were in public schools, and about 12 in every 100 (12.47 per cent) in private schools. Of the native scholars of native descent, less than four in every 100 (3.55 per cent) were in private schools; of the native born of foreign descent, nearly seven in every 100 (6.83 per cent); and of the foreign born, about two in every 100 (2.09 per cent). These percentages for the State as a whole may be profitably compared with similar percentages for the cities alone.

In the cities, of the entire number of scholars attending school during the Census year about 84 in every 100 (84.16 per cent) were attending public schools, and nearly 16 in every 100 (15.84 per cent) found in private schools. The percentages of scholars in private schools of the three classes, native born of native descent, native born of foreign descent, and foreign born, were, respectively, 4.03, 8.97, and 2.84. In the towns alone, of the entire number of scholars attending school in the Census year nearly 94 in every 100 (93.76 per cent) were in public schools, and about six in every 100 (6.24 per cent) in private schools; the percentages of scholars in private schools of the three classes, native born of native descent, native born of foreign descent, and foreign born, being, respectively, 2.66, 2.88, and 0.70.

Although the number of scholars increases from year to year and has shown an increase since the Census year, approximating, possibly, 12 per cent, it is probably true that the percentages found in public and private schools, respectively, as well as the percentages of the different classes as to birth and descent, have not materially changed. This is the first time that the different proportions represented by these different classes, or showing the respective proportions in public and private schools, have ever been brought out, and the statistics are not only of value on that account but afford a basis for future comparisons along the same lines.

As the conditions in the different cities vary according to the character of the cities, i. e., as to whether they are industrial or residential, a table is introduced showing for cities of 50,000 population or more, the percentages of scholars in public and private schools, respectively, and also the percentages of scholars native born of native descent, native born of foreign descent, and foreign born.

The Cities, and Kind of School.	Percentages of Scholars			
	Native Born, Native Descent	Native Born, Foreign Descent	Foreign Born	All Scholars
Boston,	38.30	48.94	12.76	100.00
Public schools,	34.04	41.55	11.72	87.31
Private schools,	4.26	7.39	1.04	12.69
Worcester,	42.09	46.27	11.64	100.00
Public schools,	38.00	38.41	9.96	86.37
Private schools,	4.09	7.86	1.68	13.63

The Cities, and Kind of School.	Percentages of Scholars			
	Native Born, Native Descent	Native Born, Foreign Descent	Foreign Born	All Scholars
Fall River,	23.86	52.61	23.53	100.00
Public schools,	21.69	40.49	15.70	77.88
Private schools,	2.17	12.12	7.83	22.12
Lowell,	33.90	46.91	19.19	100.00
Public schools,	29.99	33.80	10.48	74.27
Private schools,	3.91	13.11	8.71	25.73
Cambridge,	40.62	47.49	11.89	100.00
Public schools,	35.52	38.99	10.36	84.87
Private schools,	5.10	8.50	1.53	15.13
Lynn,	56.77	32.87	10.36	100.00
Public schools,	55.70	30.93	9.73	96.36
Private schools,	1.07	1.94	0.63	3.64
New Bedford,	37.99	39.48	22.53	100.00
Public schools,	32.54	26.94	13.19	72.67
Private schools,	5.45	12.54	9.34	27.33
Somerville,	50.12	39.60	10.28	100.00
Public schools,	47.51	30.47	9.10	87.08
Private schools,	2.61	9.13	1.18	12.92
Lawrence,	27.87	54.41	17.72	100.00
Public schools,	23.60	39.04	10.78	73.42
Private schools,	4.27	15.37	6.94	26.58
Springfield,	55.55	35.99	8.46	100.00
Public schools,	51.13	28.09	7.05	86.27
Private schools,	4.42	7.90	1.41	13.73

Referring to the preceding table, so far as relates to all scholars in the aggregate, it may be noted that in Boston 87.31 per cent were found in public schools, and 12.69 per cent in private schools. In Worcester, the second city in the State as to population, 13.63 per cent of all scholars were found in private schools; in Fall River, a distinctively industrial city, 22.12 per cent; in Lowell, whose population is also mainly industrial, 25.73 per cent; in New Bedford, 27.33 per cent; and in Lawrence, 26.58 per cent. As against these comparatively large percentages of pupils in private schools, we find but 15.13 per cent in the city of Cambridge, which is residential rather than industrial; only 3.64 per cent in Lynn, which again is an industrial city; 12.92 per cent in Somerville, and 13.73 per cent in Springfield.

In Boston, of all the scholars attending school, 38.30 per cent were native born of native descent; in Worcester, this percentage rises to 42.09; in Lynn it is 56.77; in Somerville, 50.12; and in Springfield, 55.55. In Fall River, the scholars native born of native descent constituted 23.86 per cent of all the scholars; in Lowell, 33.90 per cent; in New Bedford, 37.99 per cent; and in Lawrence, 27.87 per cent. Native born scholars of foreign descent constituted 48.94 per cent of all scholars in Boston, and 46.27 per cent in Worcester, the percentages in other cities being as follows: Fall River, 52.61; Lowell, 46.91; Cambridge, 47.49; Lynn, 32.87; New Bedford, 39.48; Somerville, 39.60; Lawrence, 54.41; and Springfield, 34.99.

In Fall River, 23.53 per cent of all the scholars were foreign born; in New Bedford, 22.53 per cent; in Lowell, 19.19 per cent; and in Lawrence, 17.72 per cent. Considerably lower percentages are found in the other cities included in the table, as follows: Boston, 12.76; Worcester, 11.64; Cambridge, 11.89; Lynn, 10.36; Somerville, 10.28; and Springfield, 8.46.

The following table shows for the State at large the respective proportions of males, females, and both sexes, in public schools only, native born of native descent, native born of foreign descent, and foreign born:

Nativity and Descent.	Males	Females	Both Sexes	Percentages		
				Males	Females	Both Sexes
Native born, native descent, . .	95,581	95,458	191,039	25.89	25.86	51.75
Native born, foreign descent, .	71,819	68,081	139,900	19.46	18.44	37.90
Foreign born, ...	19,309	18,920	38,229	5.23	5.12	10.35
Totals, ...	186,709	182,459	369,168	50.58	49.42	100.00

Of the scholars in the public schools, as shown by the preceding table, 50.58 per cent are males and 49.42 per cent females. The males native born of native descent constitute 25.89 per cent of the whole number of scholars; those native born of foreign descent, 19.46 per cent; and those foreign born, 5.23 per cent. On the other hand, the females native born of native descent constitute 25.86 per cent of the whole number of scholars; those native born of foreign descent, 18.44 per cent; and those foreign born, 5.12 per cent. Combining these figures it appears that of all the scholars in the public schools, 51.75 per cent are native born of native descent, 37.90 per cent, native born of foreign descent, and 10.35 per cent, foreign born. A similar table relating entirely to scholars in private schools follows.

Nativity and Descent.	Males	Females	Both Sexes	Percentages		
				Males	Females	Both Sexes
Native born, native descent, . .	6,646	8,328	14,974	12.63	15.82	28.45
Native born, foreign descent, .	12,286	16,539	28,825	23.35	31.43	54.78
Foreign born, ...	4,083	4,740	8,823	7.76	9.01	16.77
Totals, ...	23,015	29,607	52,622	43.74	56.26	100.00

We point out the percentages from this table, which may be compared with those previously presented relating to public schools. Of all the scholars in the private schools, 43.74 per cent are males and 56.26 per cent females. The males native born of native descent constitute 12.63 per cent of the whole number of these scholars; those native born of foreign descent, 23.35 per cent; and those foreign born, 7.76 per cent. The females native born of native descent comprise 15.82 per cent of the whole number of these scholars; those native born of foreign descent, 31.43 per cent; and those foreign born, 9.01 per cent. Of all the scholars in the private schools, 28.45 per cent are native born of native descent; 54.78, native born of foreign descent; and 16.77, foreign born.

For the purpose of comparison we introduce a table of the same kind relating to students.

Nativity and Descent.	Males	Females	Both Sexes	Percentages		
				Males	Females	Both Sexes
Native born, native descent, . .	7,118	5,743	12,861	41.60	33.57	75.17
Native born, foreign descent, .	1,958	1,212	3,170	11.45	7.08	18.53
Foreign born, ...	680	398	1,078	3.97	2.33	6.30
Totals, ...	9,756	7,353	17,109	57.02	42.98	100.00

Of all the students, 57.02 per cent are males and 42.98 per cent females. The males native born of native descent comprise 41.60 per cent of the entire number of students; those native born of foreign descent, 11.45 per cent; and those foreign born, 3.97 per cent. The females native born of native descent comprise 33.57 per cent of the aggregate number; those native born of foreign descent, 7.08 per cent; and the foreign born, 2.33 per cent. Of all the students, 75.17 per cent are native born of native descent; 18.53, native born of foreign descent; and 6.30 per cent, foreign born.

Illiteracy.

The presentations relating to illiteracy will be found on pages 147–237. The note on page 151 should be carefully read, as it explains the method pursued by the enumerators in collecting the information, and throws light upon the term "illiterate" as used in the Census. Without referring here to other degrees of illiteracy, it is sufficient to point out that persons reported as absolutely illiterate, that is, as unable to read or write, comprise those unable to write or to read in any language, and not merely those unacquainted with English. Persons reported as illiterate in the Census are not entirely unintelligent or entirely without education of a certain kind. They are simply analphabetes, i. e., persons unacquainted with the alphabet, the knowledge of which precedes the acquirement of education from books.

Illiteracy: By Towns. With Sex and Descent.

Illiteracy by towns, with sex and descent of the illiterates, is first considered, pages 149–171. Confining our analysis to the recapitulation for the State and counties upon pages 170, 171, we note that the total number of illiterates, using that term as explained in the note just referred to, was 127,769, of whom 53,172 were males, and 74,597 were females. The total number of illiterates constitutes 6.26 per cent of the population 10 years of age and over, the percentages of males and females being 5.40 and 7.07, respectively. The magnitude of this number of illiterates first attracts attention, but it will be noted that only 5,998 are native born of native descent, the number native born of foreign descent * being 5,824. On the other hand, of the aggregate, 115,947 are foreign born persons a large proportion of whom have been attracted to the State on account of the opportunities afforded to better their condition, but who have had no opportunity to avail themselves of the educational advantages of the Commonwealth. The respective proportions of each class of illiterates can be more clearly seen by the percentages given in the following table, which reproduces the figures for the State and for the cities as a whole, and for the towns as distinct from the cities:

Classification.	Illiterates							
	Numbers				*Percentages*			
	Native Born, Native Descent	Native Born, Foreign Descent	Foreign Born	Totals	Native Born, Native Descent	Native Born, Foreign Descent	Foreign Born	Totals
The State,	5,998	5,824	115,947	127,769	4.69	4.56	90.75	100.00
The Cities,	2,714	2,952	80,939	86,605	2.12	2.31	63.35	67.78
The Towns,	3,284	2,872	35,008	41,164	2.57	2.25	27.40	32.22

Referring to the percentages in the preceding table, it will be seen that of the total number of illiterates, nearly 91 in every 100 (90.75 per cent) are foreign born, and between four and five in every 100 are found in the classes native born, native descent, and native born, foreign descent, respectively, the actual percentages in each of these classes being 4.69 and 4.56. Of the entire number of illiterates, nearly 68 in every 100 (67.78 per cent) are found in the cities, as against about 32 in every 100 (32.22 per cent) in the towns. Of the foreign born illiterates, about 63 in every 100 (63.35 per

* See foot-note, page 278, *ante*.

cent) are found in the cities, and about 27 in every 100 (27.40 per cent) in the towns. Of the native born of native descent and native born of foreign descent, substantially identical percentages are found in the cities and towns, respectively.

Illiteracy: By Towns. With Degree of Illiteracy By Age Periods.

The second section of the statistics of illiteracy presents the subject by towns with degree of illiteracy by age periods, and may be found on pages 173–204. The recapitulation for the State and counties appears on pages 203, 204.

Confining our attention to this recapitulation, we note that, as to the State, of the total number of illiterates, 127,769, there are 108,756 unable to read or write, 18,899 who cannot write, and 114 reported unable to read. As bearing upon the question of responsibility of the State for the illiteracy found within its borders, we have previously pointed out that a large part of it is due to immigration and confined to persons of foreign birth who have been unable to avail themselves of the educational privileges given in Massachusetts. The figures in this recapitulation clearly show that the majority of the illiterates are adults; this fact being due no doubt to the coming into the State of adult persons of foreign birth who are attracted here by the opportunities of employment afforded by our industries. For example, referring once more to the figures for the State as a whole, it will be seen that of the entire number of illiterates, (127,769) 25,323 were found in the age period 20 to 29; 46,952 in the age period 30 to 49; and 46,052 in the age period 50 years and over. On the other hand, only 2,955 are found in the period 10 to 14, and 6,487 in the period 15 to 19.

It will be seen that the number of illiterates in the different counties varies considerably according to the character of the county, i. e., whether industrial or agricultural, the larger numbers being found in the counties which are extensively devoted to manufactures.

Illiteracy: By Towns. Comparisons for 1885 and 1895.

The section of the statistical presentation which may be found upon pages 205–217 affords comparisons by towns for the Census years 1885 and 1895, and enables the reader to see at a glance the increase or decrease in per capita illiteracy in 1895 as compared with the earlier year. The recapitulation for the State and counties may be found on pages 216, 217.

Referring particularly to the proportional population 10 years of age and over containing one illiterate person, we find the figures for 1885 and 1895 to be 13 and 16, respectively, so far as relates to the State at large; that is to say, there was one illiterate person to every 13 persons 10 years of age and over in the State in 1885, and one to every 16 persons in 1895, showing, of course, a diminution in the proportion of per capita illiteracy in the last named year as compared with the former. All the counties show a decrease in per capita illiteracy except the counties of Bristol and Hampshire, in which no change appears, and the counties of Barnstable, Dukes, and Nantucket, in which there are increases. The figures in each of these three last named counties, however, are comparatively small, and for that reason the change is not of great importance. For example, in Barnstable County, in 1885, there were 1,364 illiterates reported, and in 1895, 1,426; the proportional population 10 years of age and over containing one illiterate being 18 in 1885, and 16 in 1895. In Dukes County, there were only 147 illiterates in 1885, and 218 in 1895; the proportional population 10 years of age and over containing one illiterate being 24 in 1885, and 17 in 1895. In Nantucket County, which consists of the single town of Nantucket, there were but 51 illiterates reported in 1885, and 67 in 1895; the proportional population 10 years of age and over containing one illiterate being 54 in 1885, and 39 in 1895.

The following statistical summary shows the number of cities and towns showing an increase, a decrease, or no change in per capita illiteracy in 1895 as compared with 1885, with percentages:

The State, and Counties.	Number of Cities and Towns Showing —			Total Number of Cities and Towns	Percentages		
	Increase	Decrease	No Change		Increase	Decrease	No Change
The State.	113	220	20	353	32	62	6
Barnstable,	6	8	1	15	40	53	7
Berkshire,	6	26	–	32	19	81	–
Bristol,	11	7	2	20	55	35	10
Dukes,	4	3	–	7	57	43	–
Essex,	4	30	1	35	11	86	3
Franklin,	14	12	–	26	54	46	–
Hampden,	5	13	5	23	22	56	22
Hampshire,	11	9	3	23	48	39	13
Middlesex,	13	40	1	54	24	74	2
Nantucket,	1	–	–	1	100	–	–
Norfolk,	4	23	–	27	15	85	–
Plymouth,	12	14	1	27	44	52	4
Suffolk,	2	2	–	4	50	50	–
Worcester,	20	33	6	59	34	56	10

In the State at large there are 113 cities and towns which show an increase in per capita illiteracy in 1895 as compared with 1885; there are 220 which show a decrease, and 20 which show no change. Expressed in percentages, 32 per cent of the cities and towns show an increase; 62 per cent a decrease; and six per cent no change. The percentages in the different counties as shown in the table may be compared with these percentages for the State.

The proportion which the aggregate number of illiterates, native born and foreign born, respectively, bears to the aggregate population 10 years of age and over, has shown a continuous decrease so far as relates to the State at large, since 1875. To bring this clearly before the reader the following table is introduced:

Census Years.	Population 10 Years of Age and Over			Percentage of Illiterates of Population of Each Class		
	Native Born	Foreign Born	Totals	Native Born	Foreign Born	Totals
1875,	914,183	399,436	1,313,619	1.33	23.12	7.96
1885,	1,077,868	504,093	1,581,961	1.29	21.50	7.73
1895,	1,302,148	738,269	2,040,417	0.91	15.71	6.26

The foregoing table shows the population 10 years of age and over, native born, foreign born, and in the aggregate, as determined by the Decennial Censuses of 1875, 1885, and 1895, respectively. It also shows the percentage of illiterates of the population of each class, at each date. As to total population 10 years of age and over, the percentage of illiteracy was 7.96 in 1875, declining to 7.73 in 1885, and to 6.26 in 1895. The percentage of foreign born illiterates of foreign born population 10 years of age and over was 23.12 in 1875, declining to 21.50 in 1885, and to 15.71 in 1895. The percentage of native born illiterates of native born population 10 years of age and over dropped from 1.33 in 1875 to 1.29 in 1885, and was only 0.91 in 1895.

Illiteracy: By Towns. With Occupations By Classes.

The final section of the statistics of illiteracy shows the occupations of illiterates by classes, and may be found on pages 219-237. The significance of the figures in this sec-

tion lies in the evidence which they afford of the effect of the industrial development of the State upon the problem of illiteracy. In general it is of course known that, as previously noted, the enlargement of our industries has attracted to Massachusetts a considerable number of foreign born persons who, owing to the disability of early environment, have been unable to acquire an education. These have gone into various kinds of employment, and the recapitulation on pages 230, 231 brings out the significant facts for the State by counties. For example, it is there shown that of the total number of illiterates in the State (127,769), 57,170, nearly 50 per cent, are found in domestic service; 26,928 in manufactures; 16,606 are laborers (unskilled), and the others distributed in varying numbers through the different classes.

It should be remembered by the reader that the class heads employed in this recapitulation and in the table itself are general class heads and do not refer to the specific nature of the employment. The details are more particularly shown upon pages 232–237 in recapitulations for the State, in which sub-classes are presented under each general class head, with percentages as to illiteracy, also showing the sex and nativity of the illiterate.

We confine our analysis to the final recapitulation on pages 235–237. This recapitulation shows the entire population in the Commonwealth, as disclosed by the Census, with the number accredited to each occupation class, the number of illiterates in each class, and the percentage of illiterates. Similar figures are also given for the subclasses or sections under each general class head. For example, of the entire population of the State shown by the Decennial Census of 1895, namely, 2,500,183, there were 20,086 in the occupation class "Government," including persons employed by the National government, State government, city and town governments, or in the army and navy. The percentage of illiterates in the entire class was 1.09, the percentages in the various sub-classes being shown in the table. In the same way, the percentage of illiteracy in each of the other classes and sub-sections is shown.

There are some points that perhaps require explanation. For example, of the entire population, 43,768 persons appear in the class "Professional," and of these a fractional percentage, 0.34, appear as illiterates. It should be remembered that the class "Professional" includes not only persons distinctively engaged in the professions but also persons engaged in occupations connected with the administration of religion, law, medicine, literature, art, music, amusements, education, and science, these being sections, or subclasses, within the general class "Professional." Under the head of Education, in the table there appear four illiterates. These persons were probably engaged in some minor capacity in connection with some school or college building; perhaps as janitors or in some less responsible position. This statement is needed in order that an apparent peculiarity, namely, the presence of illiterates in the so-called professional class, may be explained. It is not necessary to point out in detail the various percentages and figures contained in the recapitulation, as they will be clearly apparent to the reader. It may suffice to say that, with respect to the general classes, other than those named, we find in Domestic Service 8.77 per cent illiterates; Personal Service, 7.62 per cent; Trade, 1.32 per cent; Transportation, 3.91 per cent; Agriculture, 3.77 per cent; The Fisheries, 14.47 per cent; Manufactures, 5.47 per cent; Mining (mainly quarrying), 16.65 per cent; Apprentices, 0.90 per cent; Children at Work, 7.39 per cent; Scholars, 0.47 per cent; Retired, 6.61 per cent; Not Gainful, etc., 8.87 per cent; Not Productive, eight per cent; Unemployed Twelve Months, 8.36 per cent; Dependents, 25.84 per cent; At Home, 0.23 per cent; Not Stated, 4.79 per cent.

Although the percentage of illiterates in the class Manufactures is, as stated, 5.47 per cent, some of the industries contain a much larger proportion of illiterates, the difference being due of course to the character of the industry as requiring more or less skill or intelligence in its process. For example, in the industry classified as Brick, Tiles, and Sewer Pipe, the percentage of illiterate persons employed is 37.01; this percentage being based upon a comparatively small number of persons whose principal qualification is the ability to perform manual labor rather than the possession of skill. In the cotton goods industry, the percentage of illiterates was 14.17, and in some other

textile employments a comparatively high percentage will be found. In the class Laborers (unskilled), the percentage of illiterates is 16.78, but of the agricultural laborers the percentage is 11.12, while in laborers employed in manufactures the percentage of illiterates rises to 18.71.

All Occupations. Recapitulations. For the State and Counties.

The general statistics of occupations in detail for cities and towns appear in Volume IV of the Census series. The tables contained upon pages 239–277 of the present volume include the following recapitulations: "All Occupations. For the State," pages 243–253; "All Occupations: By Counties. With Sex and Nativity," pages 254–274; and "All Occupations. For the State. With Sex, Nativity, and Percentages," pages 275–277. The attention of the reader is especially directed to the note, page 241.

In this analysis we shall confine ourselves to the last named presentation, and shall merely point out, by way of summary, its important features.

Referring to the final section, page 275, we note that the leading occupation classes numerically are Domestic Service, comprising 652,115 persons, of whom 637,238 are females; Manufactures, including 492,497, of whom 142,951 are females; Trade, in which 154,017 persons are engaged, of whom 24,142 are females; Laborers (confined to the unskilled), 98,965, of whom only 207 are females; Transportation, 70,048, including 368 females; Personal Service, 45,486, among whom are 19,762 females; Professional, 43,768, the females numbering 19,923; and Agriculture, in which 37,556 are engaged, 275 being females. The class Domestic Service includes housewives and those engaged in housework not working for wages. For Census purposes, as elsewhere explained in reference to statistics of occupations, persons attending school (scholars and students) and others not remuneratively employed are included under definite occupation heads or class titles intended to define their status, for example, "Retired," "Not Gainful, etc.," "Dependents," "At Home," etc., as specified in the tables, which include every person in the population, numbering in all, as shown in the first line of the final recapitulation to which we are now referring, 1,214,701 males and 1,285,482 females. By comparing the number of males and females given in each occupation class, respectively, with this first line, which represents the population as a whole, the proportion of males and females in each class as compared with the proportion in the population may be at once seen.

For example, using the percentages in the recapitulation, we note that in the entire population the females constitute 51.42 per cent. In some of the occupation classes in which considerable numbers of females are engaged, the percentages are as follows: Domestic Service, 25.49; Manufactures, 5.72; Trade, 0.97; Professional, 0.80; Personal Service, 0.79.

The first line of the recapitulation shows the proportions of the native and foreign born elements of the population, 30.59 per cent being foreign born. This percentage may be compared with the percentages of foreign born in the different classes, some of the larger percentages being as follows: Domestic Service, 11.33 per cent foreign born; Manufactures, 8.61; Laborers. 2.38; Trade, 1.37; Transportation, 0.98, and Personal Service, 0.77. In the section of the table, pages 275–277, similar data are presented for sub-classes under the general class heads, for example, under "Government" the following: National government, State government, city and town government, army, and navy; under "Professional," religion, law, medicine, literature, art, music, amusements, education, and science; under "Domestic Service," boarding and lodging, housewives and housework, and domestic service (private families); and so on. Comparisons between each of these sub-classes and the general classes to which they belong, or with sub-classes or general classes, or with the population as a whole, as shown in the first line of the final recapitulation on page 277, may be easily made at the pleasure of the reader.

The figures contained in these presentations are not only important in themselves in their bearing upon the social status of the population of the State, which is quite definitely shown by the statistics of occupations, but in connection with other statistics

of population contained in preceding Census volumes, and with the statistics of occupations by cities and towns contained in Volume IV, they are of use in the determination of social problems. It is apparent, of course, that they will afford a basis for comparisons with similar data in subsequent Censuses, and in that way will enable the industrial development of the State, as it affects the occupations of the people, especially with reference to the employment of women and the enlarged employment of the foreign born, to be clearly seen.

The figures are, therefore, not merely of curious interest or temporary value. Although they are the results of the final tabulations of the Census returns, and, unavoidably, considerable time has elapsed between the dates of collection and publication, they must be accepted as indicating present conditions until the returns of another Census are obtained some years hence. Indeed, it is probable that, notwithstanding some increase in numbers has taken place since the schedules were received, the proportions of the different groups, as indicated by the percentages contained in the tables, have not materially changed.
